Tables

Knitting R documents can render tables in several different forms. To start, you have your basic “console style.” This is more or less what you’d see in the console you just ran the table (or called the object) in an R script or directly in the console.

```
mydata %>%
  group_by(cyl) %>%
  summarize(
    mean.mpg = mean(mpg),
    sd.mpg = sd(mpg),
    n.models = n()
  )
```

¹This is a numbered footnote.

²This is a named footnote.

```
## # A tibble: 3 x 4
##   cyl mean.mpg sd.mpg n.models
##   <dbl>   <dbl> <dbl>   <int>
## 1     4    26.7  4.51     11
## 2     6    19.7  1.45      7
## 3     8    15.1  2.56     14
```

The `knitr` package contains the `kable()` function. Passing a dataframe into this function will produce a formatted table that's already pretty nice looking without needing additional modification. When you run the code chunk in R Studio, it is clearly different from the console version, but it's not exactly beautiful. However, that output that appears beneath your code chunk isn't the same as what you'll see when you actually knit it.

You don't need to do anything more than pipe the df to `kable()` to get this formatted table, but we can add optional arguments like `caption`.

```
mydata %>%
  group_by(cyl) %>%
  summarize(
    mean.mpg = mean(mpg),
    sd.mpg = sd(mpg),
    n.models = n()
  ) %>%
  knitr::kable(caption = "mpg stats by number of cylinders")
```

Table 1: mpg stats by number of cylinders

cyl	mean.mpg	sd.mpg	n.models
4	26.66364	4.509828	11
6	19.74286	1.453567	7
8	15.10000	2.560048	14

From there we can add in many additional arguments to tweak the visuals of this already decently formatted table exactly to our preferences. Alternatively, we can use “wrapper” functions that add in a collection of tweaks for us, like the `apa_table()` function in `papaja`, which will knit the table in APA formatting.

In this example, rather than piping the df into the function (which we could have done), the df is saved as an object that is then used as the `data` argument. Because `apa_table()` is a wrapper, we can still use the same arguments with the basic `kable()` function, like `caption`.

Some wrapper functions, including `apa_table()`, rely on LaTeX formatting that can't render in R Studio. When you run the chunk in your R notebook, you'll just see a blank box. The APA formatted table will render in your Word or PDF document. Note that not all wrapper functions will have this “blank box problem.” Other wrappers will not only not show up in R Studio, but will only render in either Word *or* PDF format.

```
mytable <- mydata %>%
  group_by(cyl) %>%
  summarize(
    mean.mpg = mean(mpg),
    sd.mpg = sd(mpg),
    n.models = n()
  )
```

```
#apa_table(mytable, caption = "mpg stats by number of cylinders")
```

Back to the basic kable, there is nearly unlimited customization you can employ, especially if you use the `kableExtra` package (which is exactly what it sounds like). Here are a handful of modifications I think you're most likely to want to know about:

1. Add a caption
2. Change column names
3. Specify column alignment
4. Format columns
5. Style table size and position
6. Make row- and column-specific tweaks
7. Group rows, columns, and cells
8. Add table (foot)notes

Many of the examples below are taken or adapted from the R Markdown Cookbook.

These tables modify column names and alignment identically but with slightly different syntax and add captions to describe each:

```
kable(iris,
  col.names = c("Sepal Length", "Sepal Width", "Petal Length", "Petal Width", "Species"),
  align = c("l", "r", "l", "r", "c"),
  caption = "Change each column name and text alignments, each with a list of strings.")
```

Table 2: Change each column name and text alignments, each with a list of strings.

These tables specify format of numeric columns:

```
d <- cbind(
  X1 = runif(3),
  X2 = 10^c(3, 5, 7),
  X3 = rnorm(3, 0, 1000))

kable(d, digits = 4,
  caption = "All numeric data in all columns display at most 4 decimal places")
```

Table 4: All numeric data in all columns display at most 4 decimal places

X1	X2	X3
0.9148	1e+03	955.9356
0.9371	1e+05	47.8847
0.2861	1e+07	-1104.5994

```
kable(d, digits = c(5, 0, 2),
      caption = "Round columns to 5, 0, and 2 digits (respectively).")
```

Table 5: Round columns to 5, 0, and 2 digits (respectively).

X1	X2	X3
0.91481	1e+03	955.94
0.93708	1e+05	47.88
0.28614	1e+07	-1104.60

```
kable(d, digits = 3,
      format.args = list(big.mark = ",", # Use US notation of including a comma (vs period) every three
                          scientific = FALSE),
      caption = "Round all data to max 3 decimal places and do not use scientific notation.")
```

Table 6: Round all data to max 3 decimal places and do not use scientific notation.

X1	X2	X3
0.915	1,000	955.936
0.937	100,000	47.885
0.286	10,000,000	-1,104.599

For the second half of the list (5-8), we need the `kableExtra` package. Most things that this package can do will work in both Word and PDF outputs, but Word does not support LaTeX formatting. As a result, the results are pretty iffy. Sticking with PDF output format is recommended. If you need to knit to a Word doc, refer to the package documentation for suggestions on how to do so.

This package includes the `kbl()` function, which is *identical* to `kable()`. If you have `kableExtra` loaded you can use either, but the advantage of using `kbl()` is that it will throw an obvious error if you don't have the package loaded, which you might not notice otherwise.

To use styling functions in the `kableExtra` package, you'll create a kable with `kable()` or `kbl()` and pipe (`%>%`) it into the style function. Examples in this section come from the `kableExtra` package documentation.

```
library(kableExtra)
```

```
##
## Attaching package: 'kableExtra'

## The following object is masked from 'package:dplyr':
##
## group_rows
```

```
dt <- mtcars[1:5, 1:6]
```

By default, knitr will place tables wherever it thinks the best place in your document for that table will be. This is often great, but sometimes it's a very bad guesser. It will also guess the size/scale your table should be. You can control these things yourself.

In Table @ref(tab:table-hold-position), the `hold_position` style option “pins” the table where you call it. Most examples from here on will include this argument.

```
kbl(dt,
  caption = "Table will appear exactly where you call it."
) %>%
kable_styling(latex_options = "hold_position")
```

Table 7: Table will appear exactly where you call it.

	mpg	cyl	disp	hp	drat	wt
Mazda RX4	21.0	6	160	110	3.90	2.620
Mazda RX4 Wag	21.0	6	160	110	3.90	2.875
Datsun 710	22.8	4	108	93	3.85	2.320
Hornet 4 Drive	21.4	6	258	110	3.08	3.215
Hornet Sportabout	18.7	8	360	175	3.15	3.440

Table @ref(tab:table-size-scaledown), shows the use of the `scale_down` option (with `hold_position`) to scale a wide table down to fit on the page. This can be used instead of or in addition to printing the table in landscape page format. See the `kableExtra` docs for how to do that.

```
kbl(cbind(dt, dt, dt), # create a very wide table
  caption = "When you have a wide table that will normally go out of the page, and you want to scale it down"
) %>%
kable_styling(latex_options = c("striped", "scale_down", "hold_position"))
```

Table 8: When you have a wide table that will normally go out of the page, and you want to scale down the table to fit the page, you can use the scale down option.

	mpg	cyl	disp	hp	drat	wt	mpg	cyl	disp	hp	drat	wt	mpg	cyl	disp	hp	drat	wt
Mazda RX4	21.0	6	160	110	3.90	2.620	21.0	6	160	110	3.90	2.620	21.0	6	160	110	3.90	2.620
Mazda RX4 Wag	21.0	6	160	110	3.90	2.875	21.0	6	160	110	3.90	2.875	21.0	6	160	110	3.90	2.875
Datsun 710	22.8	4	108	93	3.85	2.320	22.8	4	108	93	3.85	2.320	22.8	4	108	93	3.85	2.320
Hornet 4 Drive	21.4	6	258	110	3.08	3.215	21.4	6	258	110	3.08	3.215	21.4	6	258	110	3.08	3.215
Hornet Sportabout	18.7	8	360	175	3.15	3.440	18.7	8	360	175	3.15	3.440	18.7	8	360	175	3.15	3.440

You can also scale *up* a table to make a small/narrow table full width with either the `scale_up` option (Table @ref(tab:table-size-scaleup)) or `full_width` argument (Table @ref(tab:table-size-fullwidth)).

```
kbl(cbind(dt,
  caption = "Use the scale up option to stretch to full page width."
) %>%
kable_styling(latex_options = c("striped", "scale_up", "hold_position"))
```

```
kbl(dt,
  caption = "Stretch a small table to fit the page with the full width option."
) %>%
kable_styling(full_width = T, latex_options = c("hold_position"))
```

When you have very long tables that would extend over multiple pages, use the `longtable` argument, usually in combination with the `repeat_header` option (Table @ref(tab:table-size-longtable)).

```
long_dt <- rbind(mtcars, mtcars) # create a very long table
kbl(long_dt,
  longtable = T,
  caption = "Use the 'longtable' argument in the kbl() to intelligently manage very long tables. Use the 'repeat_header' argument to repeat the header for each page. Use the 'full_width' argument to stretch the table to full width."
) %>%
# add_header_above(c(" ", "Group 1" = 5, "Group 2" = 6)) %>%
kable_styling(latex_options = c("repeat_header", "hold_position"))
```

Table 9: Use the scale up option to stretch to full page width.

By default, tables are aligned center on the page, but they can also be aligned left or right. Note that alignment does not apply to full width tables. Table @ref(tab:table-alignleft) uses the `position = "left"` argument to align left. Oddly, aligning right in the same way doesn't work as expected. In theory you can "float right" rather than position right, but this can produce errors. It's unlikely you'll need to right align a table though.

```
kbl(dt,
  caption = "Align your table (not the text, the whole table), 'left' or 'center' (the default) with the position argument.",
  kable_styling(position = "left", latex_options = c("hold_position"))
```

Table 12: Align your table (not the text, the whole table), 'left' or 'center' (the default) with the position argument.

	mpg	cyl	disp	hp	drat	wt
Mazda RX4	21.0	6	160	110	3.90	2.620
Mazda RX4 Wag	21.0	6	160	110	3.90	2.875
Datsun 710	22.8	4	108	93	3.85	2.320
Hornet 4 Drive	21.4	6	258	110	3.08	3.215
Hornet Sportabout	18.7	8	360	175	3.15	3.440

You can make style adjustments to the whole table (e.g., font fact, background color, bold/italic) or to specific rows and columns. Table @ref(tab:table-col-specs) includes three `column_spec` functions to modify properties in columns 2, 6, and 9.

```
mtcars[1:8, 1:8] %>%
kbl(booktabs = T,
  caption = "This table uses column specifications to make many visual modifications to individual rows and columns.",
  kable_paper(full_width = F) %>%
  column_spec(2, color = spec_color(mtcars$mpg[1:8]),
    link = "https://haozhu233.github.io/kableExtra") %>%
  column_spec(6, color = "white",
    background = spec_color(mtcars$drat[1:8], end = 0.7),
    popover = paste("am:", mtcars$am[1:8])) %>%
# The c(rep(XX,7), XX) bit here is basically saying
# in this column (9) treat the first 7 columns one way and then the rest (the last)
# this other way. e.g., strikeout should be FALSE for the 1st seven rows but TRUE
# for the rest, color should be BLACK for 1-7 but RED for the rest
  column_spec(9, strikeout = c(rep(F, 7), T), bold = c(rep(F, 7), T),
    color = c(rep("black", 7), "red"))
```

Table @ref(tab:table-row-specs) includes two `row_spec` functions to modify properties in rows 1 and rows 3-5.

Table 13: This table uses column specifications to make many visual modifications to individual rows. The final line shows how the same function can modify just one cell in a column in a similar way.

	mpg	cyl	disp	hp	drat	wt	qsec	vs

  row_spec(1, strikeout = T) %>%
  row_spec(3:5, bold = T, color = "white", background = "black")
```

You can “group” rows and columns, basically equivalent to merging cells in a spreadsheet. This is commonly needed for multi-level headers or organizing non-rectangular data (like a lot of model output). Table @ref(tab:table-grouping-addheader) uses the `add_header_above()` function to do so.

```
kbl(dt,
    caption = "Create grouped columns by adding a header.") %>%
  kable_styling(latex_options = c("striped", "hold_position")) %>%
  # The syntax within the list is "name of group header = [number of columns to be grouped under it]. M
  add_header_above(c(" " = 1, "Group 1" = 2, "Group 2" = 2, "Group 3" = 2))
```

Table 15: Create grouped columns by adding a header.

Datsun 710	22.8	4	108	93	3.85	2.320
Hornet 4 Drive	21.4	6	258	110	3.08	3.215
Hornet Sportabout	18.7	8	360	175	3.15	3.440

You can group more than once and format these header rows individually. Use the total number of rows to specify how many columns to group, not the number of rows in the grouped row below it (Table @ref(tab:table-grouping-multiple)).

```
kbl(dt,
    caption = "Group multiple times and format these header rows individually.") %>%
  kable_styling(latex_options = c("striped", "hold_position")) %>%
  # If you don't specify how many columns to group for that group name, it assumes =1
  add_header_above(c(" ", "Group 1" = 2, "Group 2" = 2, "Group 3" = 2)) %>%
  add_header_above(c(" ", "Group 4" = 4, "Group 5" = 2)) %>%
  add_header_above(c(" ", "Group 6" = 6), bold = T, italic = T)
```

Grouping rows is a little different. Table @ref(tab:table-grouping-packrows) uses the `pack_rows()` function to effectively add “header rows” throughout the table.

Table 16: Group multiple times and format these header rows individually.

	<i>Group 6</i>					
	Group 4				Group 5	
	Group 1		Group 2		Group 3	
	mpg	cyl	disp	hp	drat	wt
Mazda RX4	21.0	6	160	110	3.90	2.620
Mazda RX4 Wag	21.0	6	160	110	3.90	2.875
Datsun 710	22.8	4	108	93	3.85	2.320
Hornet 4 Drive	21.4	6	258	110	3.08	3.215
Hornet Sportabout	18.7	8	360	175	3.15	3.440

```
kbl(mtcars[1:10, 1:6],
    caption = "Group rows using packing.") %>%
  kable_styling(latex_options = c("striped", "hold_position")) %>%
  # syntax here is ("group label", [int of first row to include in group][int of last row to include])
  pack_rows("Group 1", 4, 7) %>%
  pack_rows("Group 2", 8, 10)
```

Table 17: Group rows using packing.

	mpg	cyl	disp	hp	drat	wt
Mazda RX4	21.0	6	160.0	110	3.90	2.620
Mazda RX4 Wag	21.0	6	160.0	110	3.90	2.875
Datsun 710	22.8	4	108.0	93	3.85	2.320
Group 1						
Hornet 4 Drive	21.4	6	258.0	110	3.08	3.215
Hornet Sportabout	18.7	8	360.0	175	3.15	3.440
Valiant	18.1	6	225.0	105	2.76	3.460
Duster 360	14.3	8	360.0	245	3.21	3.570
Group 2						
Merc 240D	24.4	4	146.7	62	3.69	3.190
Merc 230	22.8	4	140.8	95	3.92	3.150
Merc 280	19.2	6	167.6	123	3.92	3.440

```
collapse_rows_dt <- data.frame(C1 = c(rep("a", 10), rep("b", 5)),
                                C2 = c(rep("c", 7), rep("d", 3), rep("c", 2), rep("d", 3)),
                                C3 = 1:15,
                                C4 = sample(c(0,1), 15, replace = TRUE))
```

Alternatively, use `collapse_rows()` (Table @ref(tab:table-grouping-collapse)) for more of a “merge cells” effect.

```
collapse_rows_dt <- data.frame(C1 = c(rep("a", 10), rep("b", 5)),
                                C2 = c(rep("c", 7), rep("d", 3), rep("c", 2), rep("d", 3)),
                                C3 = 1:15,
                                C4 = sample(c(0,1), 15, replace = TRUE))
```

```
# You will only see the "collapse" happen when you knit
# not when you run the chunk
```

Table 18: Collapse rows for more of a 'merge cells' effect.

C1	C2	C3	C4
a	c	1	0
		2	1
		3	0
		4	0
		5	0
		6	0
		7	1
	d	8	1
		9	1
		10	1
b	c	11	0
		12	1
	d	13	0
		14	1
		15	1

```
kbl(collapse_rows_dt, booktabs = T, align = "c",
    caption = "Collapse rows for more of a 'merge cells' effect.") %>%
column_spec(1, bold=T) %>%
collapse_rows(columns = 1:2,
    latex_hline = "major",
    row_group_label_position = "first")
```

Finally, you can add notes or footnotes below your table with the `footnote()` function. Table @ref(tab:table-footnotes) includes the 'general' argument for an unlabeled note and 'number', 'alphabet', and 'symbol' for footnotes with ordered labels.

```
kbl(dt, align = "c",
    caption = "Add unordered (general) and ordered footnotes.") %>%
kable_styling(full_width = F) %>%
footnote(general = "Here is a general comments of the table. ",
    number = c("Footnote 1; ", "Footnote 2; "),
    alphabet = c("Footnote A; ", "Footnote B; "),
    symbol = c("Footnote Symbol 1; ", "Footnote Symbol 2"))
```

There is **so much more** you can do with kables! I am personally a huge fan of kables and the `kableExtra` package because it works beautifully with `papaja`, but you can also explore other packages for making beautiful tables:

- `flextable`
- `gt` table
- `xtable`
- `stargazer`
 - This one is designed to simplify tables for regression output

Table 19: Add unordered (general) and ordered footnotes.

	mpg	cyl	disp	hp	drat	wt
Mazda RX4	21.0	6	160	110	3.90	2.620
Mazda RX4 Wag	21.0	6	160	110	3.90	2.875
Datsun 710	22.8	4	108	93	3.85	2.320
Hornet 4 Drive	21.4	6	258	110	3.08	3.215
Hornet Sportabout	18.7	8	360	175	3.15	3.440

Note:

Here is a general comments of the table.

¹ Footnote 1;

² Footnote 2;

^a Footnote A;

^b Footnote B;

^{*} Footnote Symbol 1;

[†] Footnote Symbol 2
